Lesson 08: Exercises and Consolidation

A LEADING POLYTECHNIC COMMITTED TO YOUR SUCCESS

Lesson Objectives

By the end of this lesson, students should be able to:

- Apply styling techniques to improve UI clarity and consistency
- Implement navigation between multiple screens
- Capture and respond to basic user input
- Debug common UI, navigation, and input-related issues
- Integrate multiple foundational concepts into one cohesive application flow

Lesson Roadmap

1. Review what module 2 already covered
2. Explain today's exercise categories and success criteria
3. Choose a work path
4. Complete required tasks
5. Check progress and triage repairs
6. Wrap up and quiz-prep reminder

What This Lesson Is

- a structured work period
- a chance to catch up or stabilize weak areas
- guided practice before the first quiz

What this lesson is not

- a new feature lesson
- a free-form project day
- a time to ignore broken foundations

Three Required Exercise Categories

1. Styling clarity
2. Navigation flow
3. Input-driven interaction

Optional challenge

- integrate the three areas into one smoother application flow if the required tasks are already stable

Work Path Decision

Path A: Ready to build

- your project already runs
- styling, navigation, and input all basically work
- you can start the required tasks immediately

Path B: Needs repair first

- one of the three foundation areas is still partial or blocked
- you should repair that area before treating the exercise set as complete

Required Success Standard

- one readable styled screen or flow
- working navigation between screens
- one working input interaction with visible response
- a clear explanation of what was fixed or improved

Incomplete but acceptable progress

- if the full integration is not working yet, students must leave with:
- the current blocker named clearly
- the exact repair target identified
- one next action recorded

Important distinction

- **quiz-ready** means the required integration is working
- **still repairing** means the blocker is documented, but the required integration is not finished yet

Use These Files In Order

1. `work-session-checklist.md`
2. `worked-example.md`
3. `exercise.md`
4. `success-criteria.md`
5. `recovery-paths.md` if blocked
6. `progress-tracker.md` before the checkpoint

Common Work-Session Mistakes

- jumping to the optional challenge before the required tasks are stable
- trying to fix styling, navigation, and input all at once
- staying in a blocked state without switching to a repair path
- finishing code changes without checking the success criteria

Midpoint Check

By the middle of class, students should know:

- which required tasks are already complete
- which one remaining blocker matters most
- whether they are building or repairing

Instructor priority

- move blocked students back to the correct lesson artifact quickly

Worked Example Launch

- default styling cleanup anchor: `src/app/index.js`
- default navigation check anchors: `src/app/_layout.tsx`, `src/app/index.js`,
`src/app/details.js`
- default input anchor: `src/app/details.js`

Review terms

- `route` : a screen file
- `event` : something the app responds to
- `handler` : the code that responds
- `visible response` : what changes on screen after the action

Checkpoint

Students should be ready to show

- if you are on the `build` path:
- a project that integrates styling, navigation, and input
- if you are on the `repair` path:
- the repaired area working, or a precisely documented blocker and next action

Students should also be able to answer

- Which required task was easiest?
- Which required task was hardest?
- What exactly did you fix or improve today?
- What still needs repair before the quiz, if anything?

What We Learned Today

- how the module-2 skills fit together
- which weak spots still need repair
- how to verify whether a project is really stable
- how to explain debugging and improvement decisions clearly

Next Step

- review the completed exercise work
- use your progress tracker to identify any remaining repair target
- prepare for the quiz using the same styling, navigation, and input foundations

Ready after lesson 08 means

- `quiz-ready` : styling, navigation, and input are all working together
- `still repairing` : the remaining blocker is precisely documented and limited
